SKIN SENSITIZATION

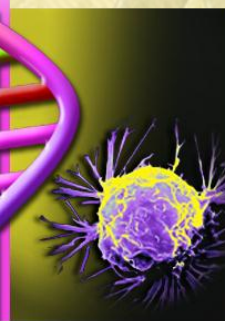

MUTAGENICITY

CARCINOGENICITY

DEVELOPMENTAL TOXICITY

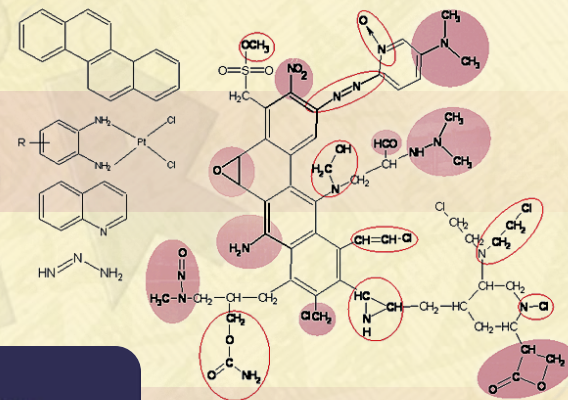

Mutagenicity

Classification Models

QSAR models of noncongeneric compounds to predict mutagenicity can use TWO APPROACHES:

1 : STRUCTURAL ALERTS

2 : STATISTICS

CAESAR MODELLING FOR MUTAGENICITY

Dataset

- **Kazius-Bursi Mutagenicity Dataset** (*Kazius et al. J Med Chem, 2005*), originally containing **4337 chemical compounds**, supplied by R. Bursi
- Data are *categorical*
- Following quality checks the database has been pruned and modified to **4225 compounds**: 2358 classified as *mutagens* and 1867 classified as *non-mutagens* by *Ames test*
- For validation, the dataset has been divided into training (**80%**) and test (**20%**) sets

CAESAR MODELLING FOR MUTAGENICITY

Descriptors

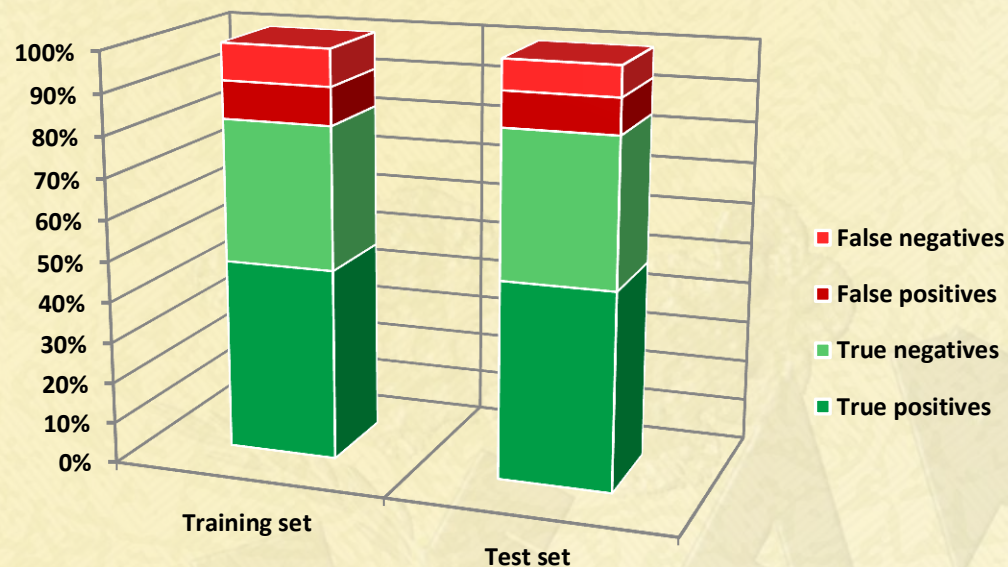

- 2D descriptors: MDL software

Models

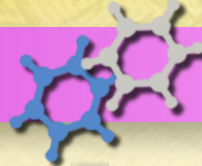

- Classification: **SVM** (Support Vector Machines)
- 10 fold cross-validation

Results of Modelling

- Good accuracy (considering reproducibility of the experimental data about 85%)
- A cost-sensitive model was also evaluated to reduce *FN*

Architecture of the Integrated System

3 STEPS IN CASCADE:

- **statistical model**
(based on chemical descriptors)
- **knowledge-based filter** (based on structural alerts)

SUSPICIOUS

NON-MUTAGENIC

ToxTree vs SVM

COMPARISON OF PERFORMANCE (*on the same data*):

CAESAR Test Set	Toxtree	SVM model
<i>accuracy:</i>	78%	✓ 83%
<i>sensitivity:</i>	86%	✓ 87%
<i>specificity:</i>	69%	✓ 79%

Integrated Model Statistics

CAESAR Test Set	SUSPICIOUS taken as NON-MUTAGENIC	SUSPICIOUS taken as MUTAGENIC
<i>accuracy:</i>	83.3%	82.1%
<i>sensitivity:</i>	88.3%	90.9%
<i>specificity:</i>	77.1%	71.2%

CONFIDENT CHOICE

Accuracy close to the reliability of the experimental test (85%)

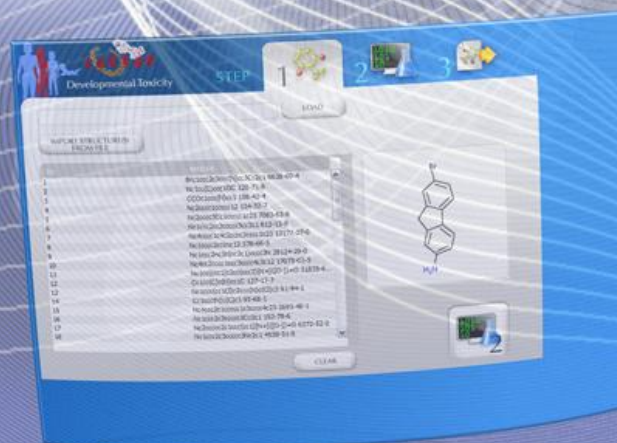

PRUDENT CHOICE

Sensitivity boosted over 90%

Mutagenicity: Conclusions

- The **cascade model** has achieved a classification accuracy close to the reliability of the *Ames test* data (***average interlaboratory reproducibility error of 15%***) used to train and validate the model;
- The experimental error is a major bottleneck;
- This gives evidence that very good performance is possible with machine learning software from public domain;
- Selected structural alerts can discover FN (but can moderately increase FP as well);
- The CAESAR model has been checked against commercial systems (Multicase, Derek); it gave always not worse results.
