

Using Adverse Outcome Pathways to Group Chemicals into Toxicologically Relevant Categories

Mark Cronin
Liverpool John Moores University
England

(Quantitative) Structure-Activity Relationships ((Q)SARs)

- ▶ Relate chemical structure to toxicity

Structural Fragment = Toxicity

Toxic Potency = f (Chemistry)

- ▶ Allow for prediction of toxicity from structure
 - ▶ Product development
 - ▶ Data gap filling

When Does (Q)SAR Work?

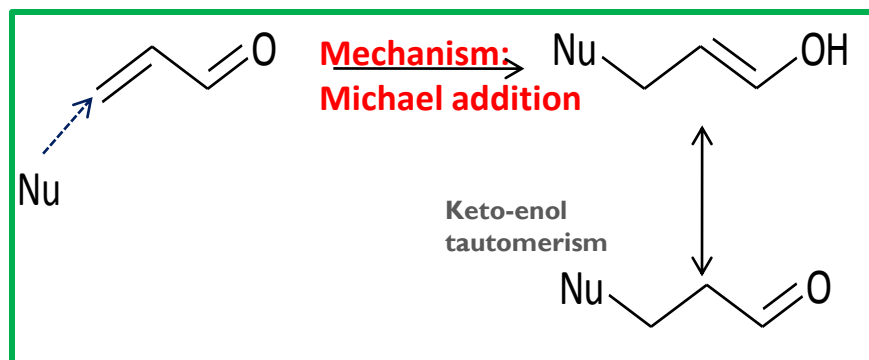

- ▶ When a steady state / equilibrium is reached
 - ▶ Controlled by a small number of variables
 - ▶ Aquatic acute toxicity, but seldom rodent LD₅₀
- ▶ When there is a single, definable and rate limiting “initiating event”
 - ▶ Receptor binding e.g. HERG
 - ▶ Covalent binding e.g. skin sensitisation, genotoxicity
- ▶ When it is used intelligently as part of a strategy and /or consensus
 - ▶ Limitations and context are understood

When Does **NOT** (Q)SAR Work?

- ▶ Lack of data and mechanistic understanding
- ▶ Modelling too complex phenomena
 - ▶ Chronic, systemic, reproductive toxicity
- ▶ Does not account for ADME
- ▶ Statistical goobledygook and over-fitting
 - ▶ It is easy to derive an a statistical relationship if you
 - ▶ 1. Ignore biology
 - ▶ 2. Calculate enough descriptors
 - ▶ 3. Accept 75% accuracy

Mechanism and Mode of Toxic Action

- ▶ How toxicity is brought about at the molecular level resulting in effects at organ or organism level

- ▶ If we understand mechanism and modes, we understand toxicology, predict it and justify predictions

Grouping Chemicals Together Rationally Seen as a Solution to Some of the Problems

- ▶ Find similar chemicals to the “target”
 - ▶ Various methods to identify similar chemicals
 - ▶ Similarity should be based on a rational, preferably mechanistic, basis
- ▶ Obtain toxicological data for the similar chemicals
- ▶ Interpolate the activity – known as read-across
- ▶ The freely OECD QSAR Toolbox helps this process
 - ▶ High usage for e.g. REACH dossiers
- ▶ A “Toxicologically Relevant Category” is one that groups chemicals according a known mechanism or mode of action

Skin Sensitisation: Electrophilic Reactivity Essential

Category Formation for Skin Sensitisation

Target

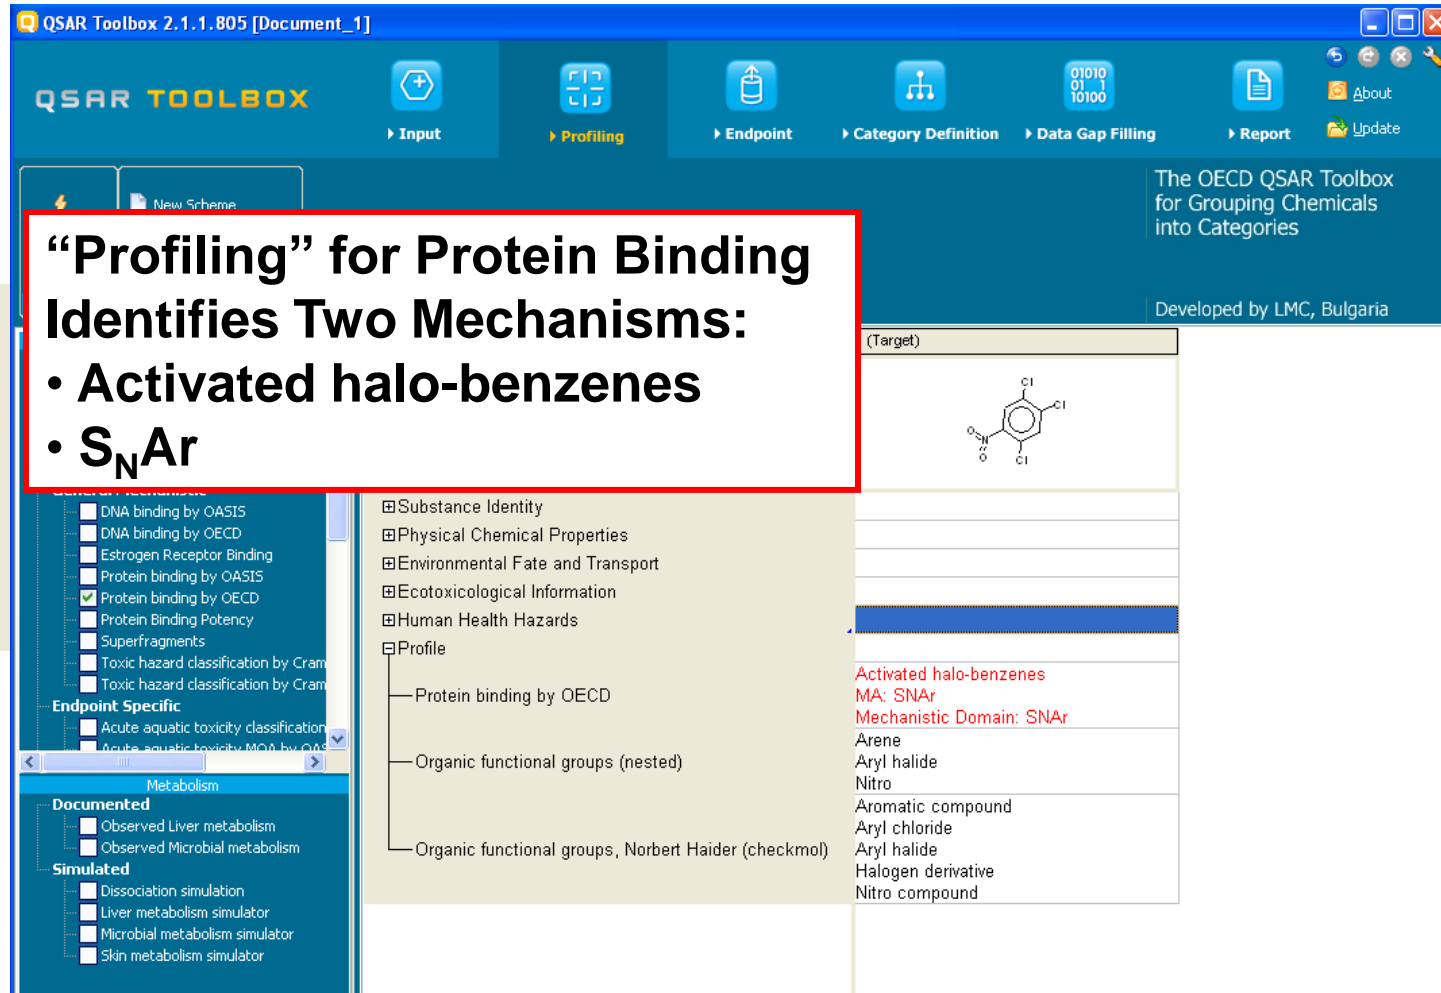

Mechanisms for Grouping

Target

“Profiling” for Protein Binding Identifies Two Mechanisms:

- Activated halo-benzenes
- S_NAr

The screenshot shows the QSAR Toolbox 2.1.1.805 interface. The top navigation bar includes buttons for Input, Profiling (highlighted), Endpoint, Category Definition, Data Gap Filling, and Report. The main window displays a list of endpoints on the left, with 'Protein binding by OECD' selected. The central pane shows a hierarchical tree of categories, including 'Profile' and 'Organic functional groups (nested)'. The right pane shows the 'Target' section with the chemical structure of 2,4-dichloro-1-nitrobenzene and a list of identified mechanisms: 'Activated halo-benzenes', 'MA: S_NAr ', and 'Mechanistic Domain: S_NAr '. Below this, a list of chemical classes is shown, including 'Arene', 'Aryl halide', 'Nitro', 'Aromatic compound', 'Aryl chloride', 'Aryl halide', 'Halogen derivative', and 'Nitro compound'.

Positive

Importance of Mechanistic Category Formation

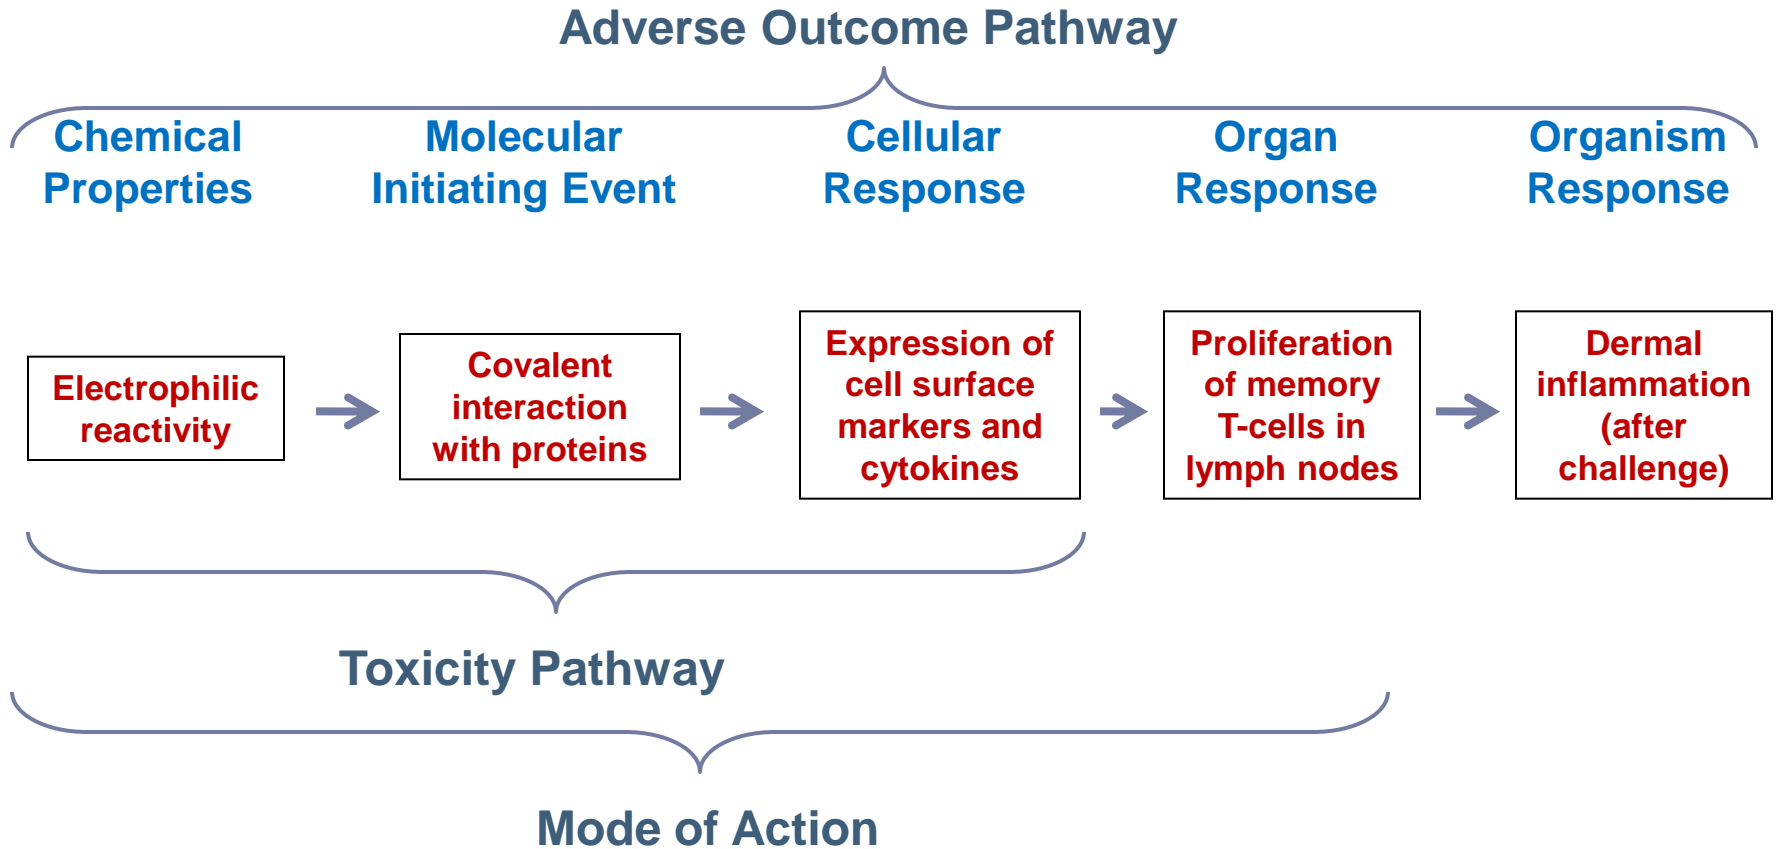

- ▶ Demonstrates direct link from chemistry to toxicology
- ▶ Enshrined within the OECD Principles for Validation of QSARs
- ▶ Makes regulatory submissions more acceptable
- ▶ However, more work needed to translate mechanisms to chemistry
- ▶ Adverse Outcome Pathways provide a solution, particularly for complex toxicities

Adverse Outcome Pathways (AOPs)

Schultz TW (2010), In Cronin MTD, Madden JC (eds) *In Silico Toxicology: Principles and Applications*, Royal Society of Chemistry. pp. 346-371

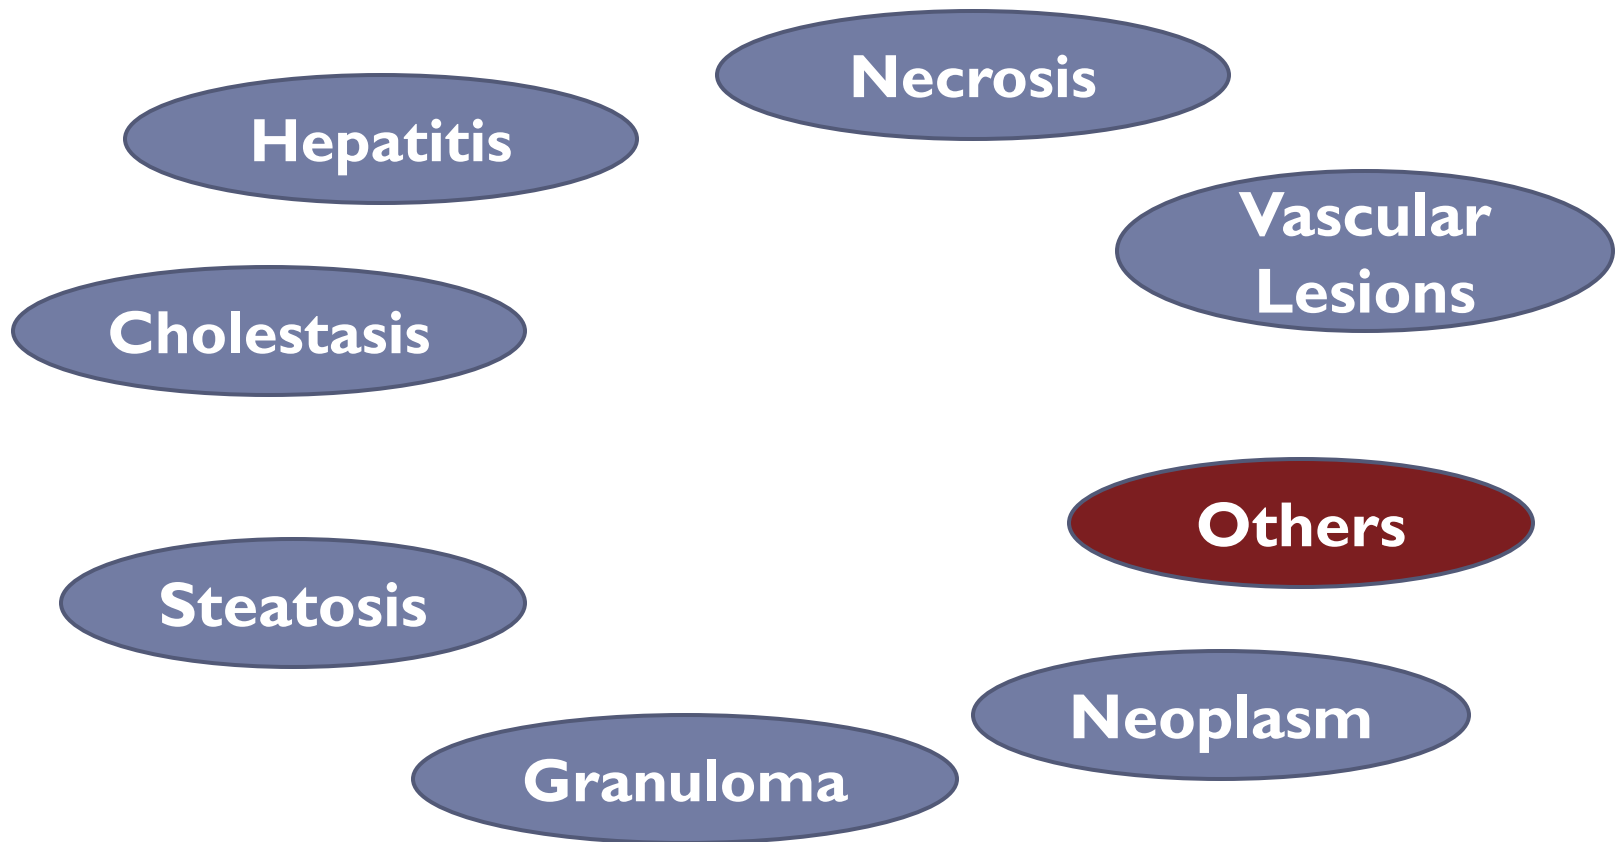

Adverse Outcome Pathways (AOPs): An Example for **Skin Sensitisation**

Shamelessly adapted from OECD Documentation

Predicting Systemic Toxicity and Organ Level Effects

Modelling Toxicity to the Liver

Traditional QSAR

Find data

[Determine Mechanisms]

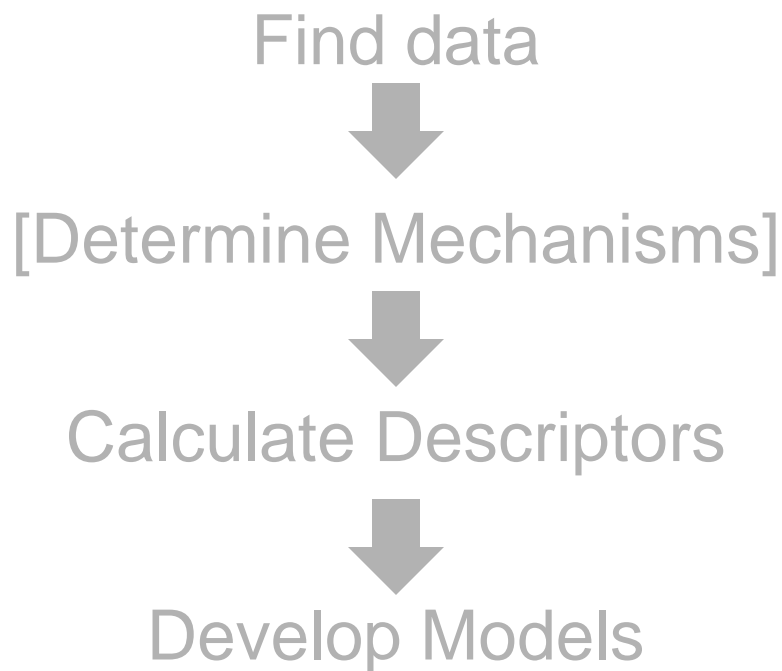

Calculate Descriptors

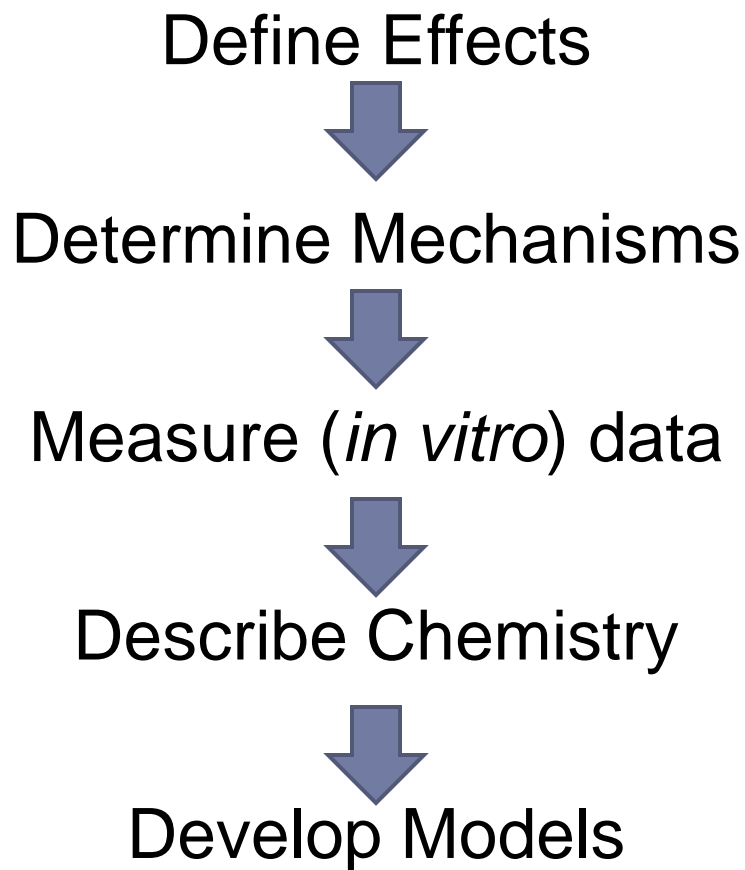

Develop Models

Traditional QSAR

Future *In Silico* Modelling QSAR

Future *In Silico* Modelling QSAR

Define Effects

Liver toxicity, possible death

Determine Mechanisms

Covalent hepatotoxicity

Measure (*in vitro*) Data

Binding data

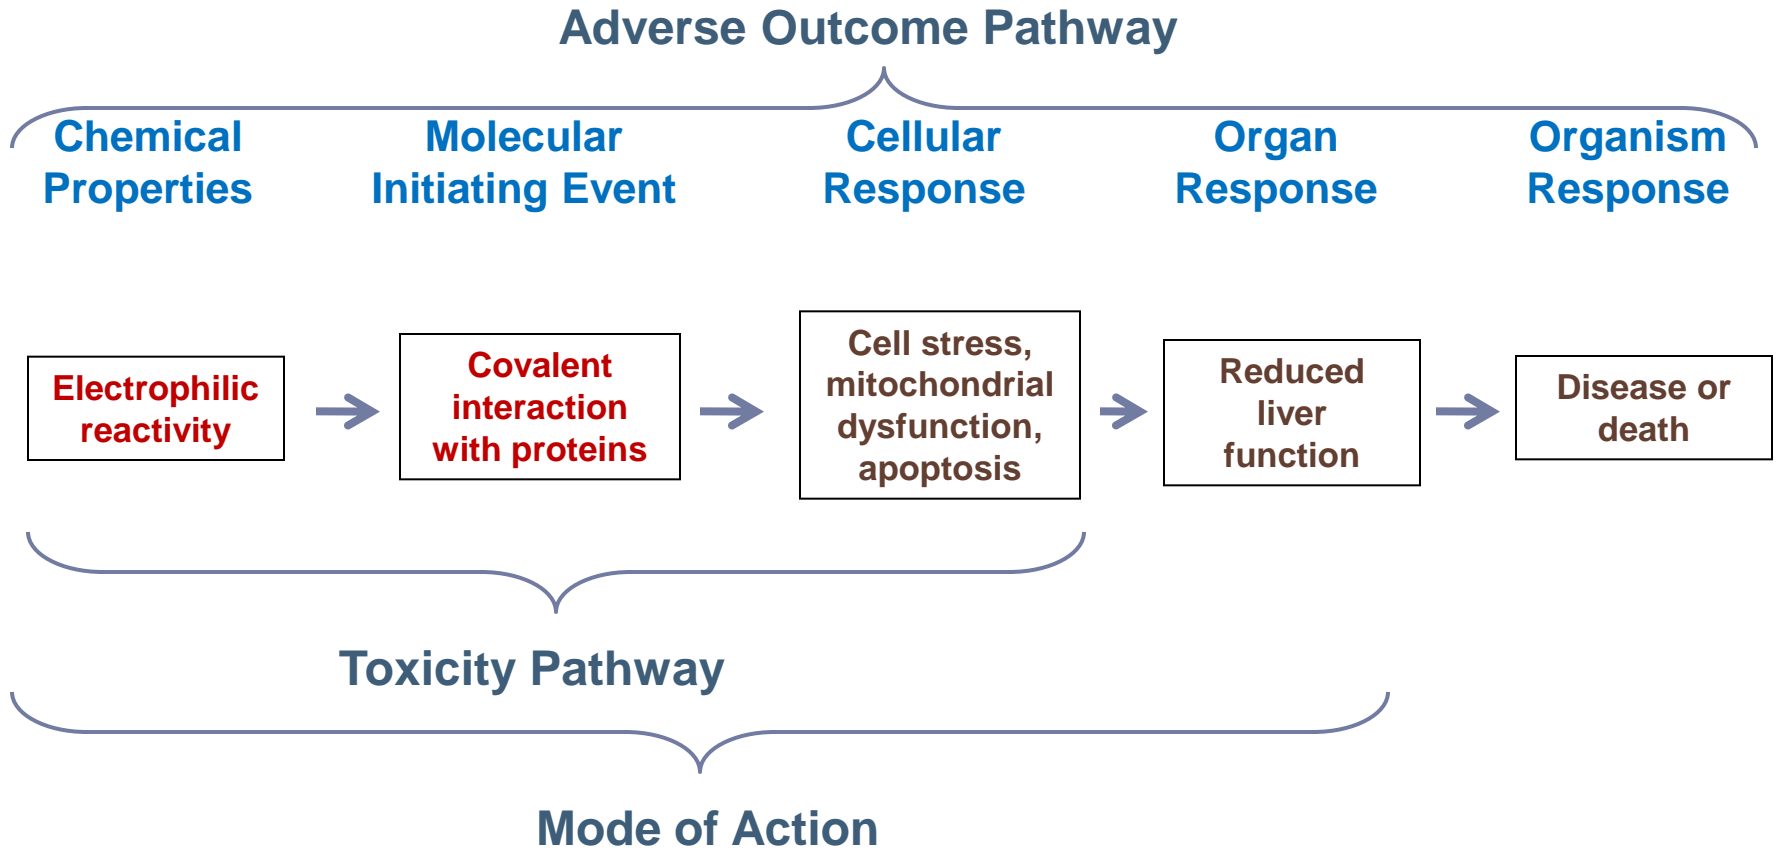

Describe Chemistry

Domains of electrophilic reactivity

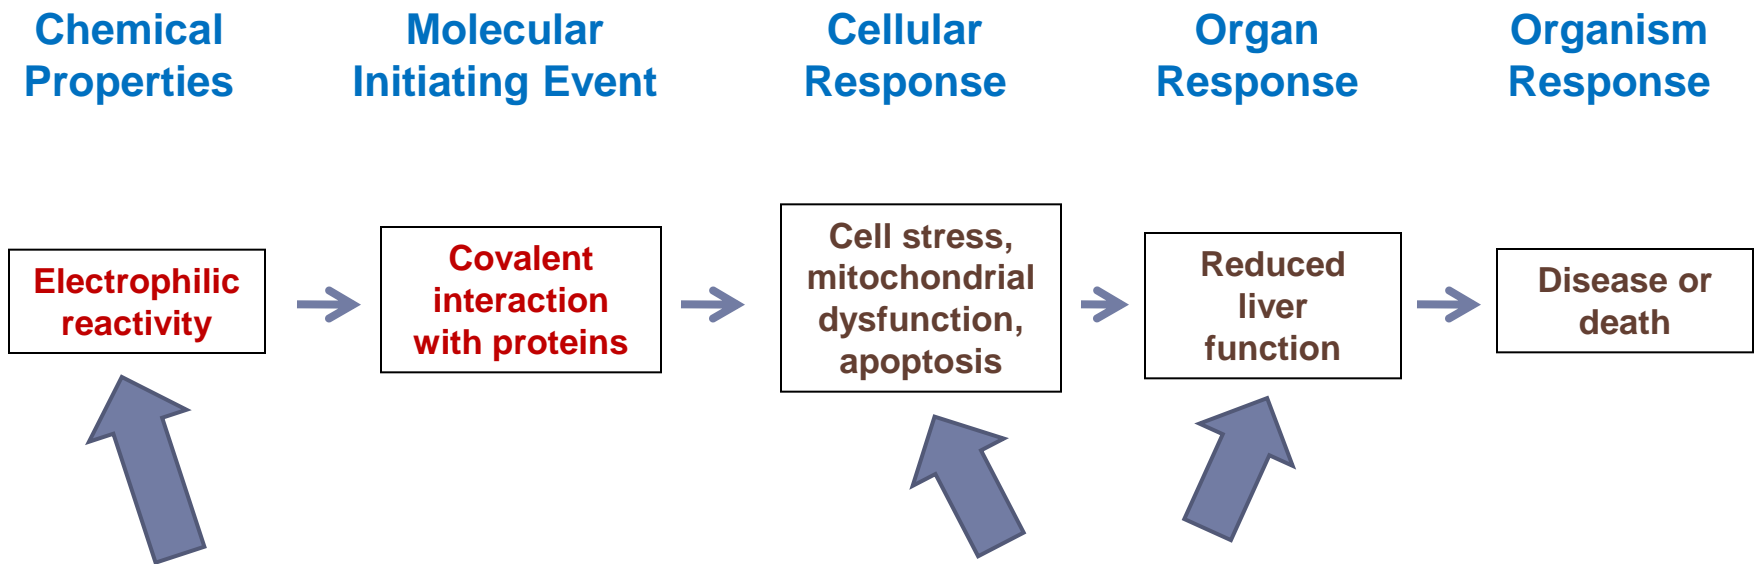

Develop Models

Groupings of compounds

Adverse Outcome Pathways (AOPs): An Example for Heptatotoxicity

Adverse Outcome Pathways (AOPs): An Example for Hepatotoxicity

- Can be defined in terms of chemistry
- Chemical definitions can be used to group compounds together

- Opportunity to use *in vitro* assays and “intelligent” testing to define chemical space associated with AOP

Defining Electrophilic Chemistry Related Toxicity

Mechanistic domain

Protein binding reaction

Modified protein

Michael acceptors

$\text{S}_{\text{N}}\text{Ar}$ electrophiles

$\text{S}_{\text{N}}2$ electrophiles

Schiff base formers

Acylation agents

Use of Structural Alerts: SARs vs Grouping / Category Formation

- ▶ SARs e.g. Toxtree, Derek Nexus
 - ▶ An alert is linked directly to toxicity
 - ▶ Much direct toxicological evidence
 - ▶ Often highly defined
 - ▶ Absence of an alert does not infer safety

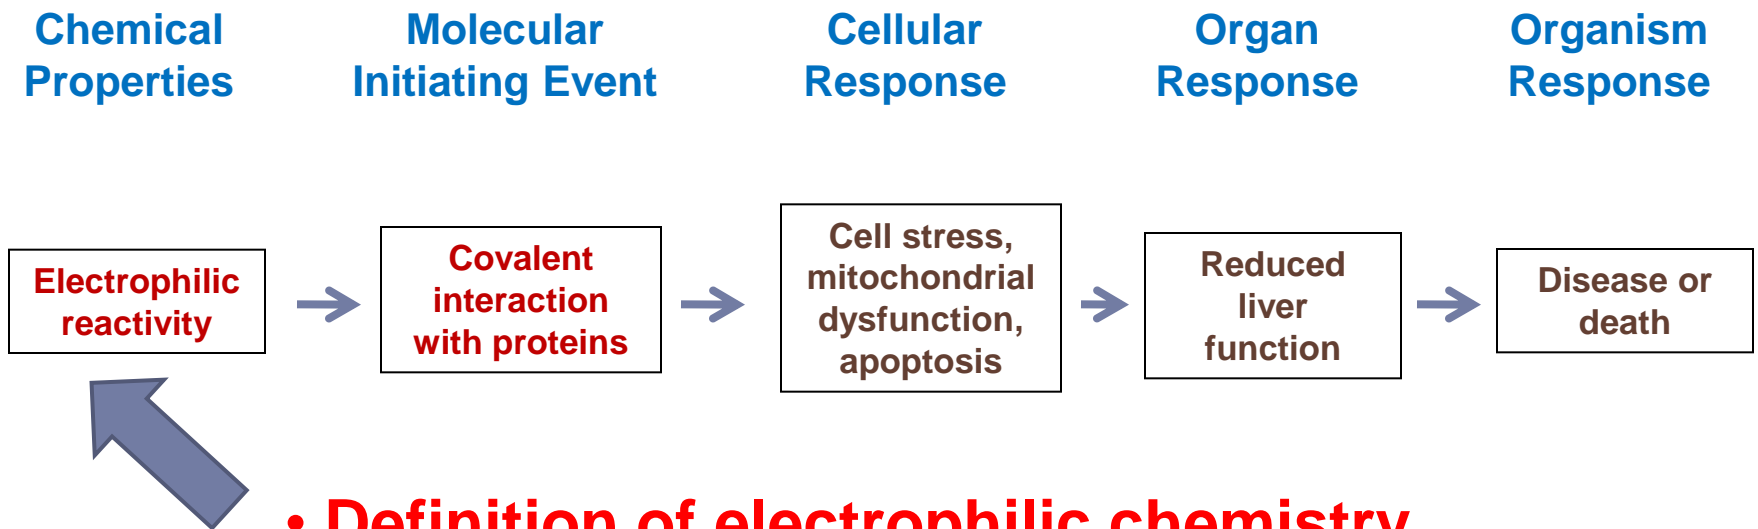

Toxicity

- ▶ Grouping e.g. OECD QSAR Toolbox
 - ▶ Chemistry groups compounds
 - ▶ May be loosely defined
 - ▶ Category may include negatives
 - ▶ Read-across applied by user to make the prediction

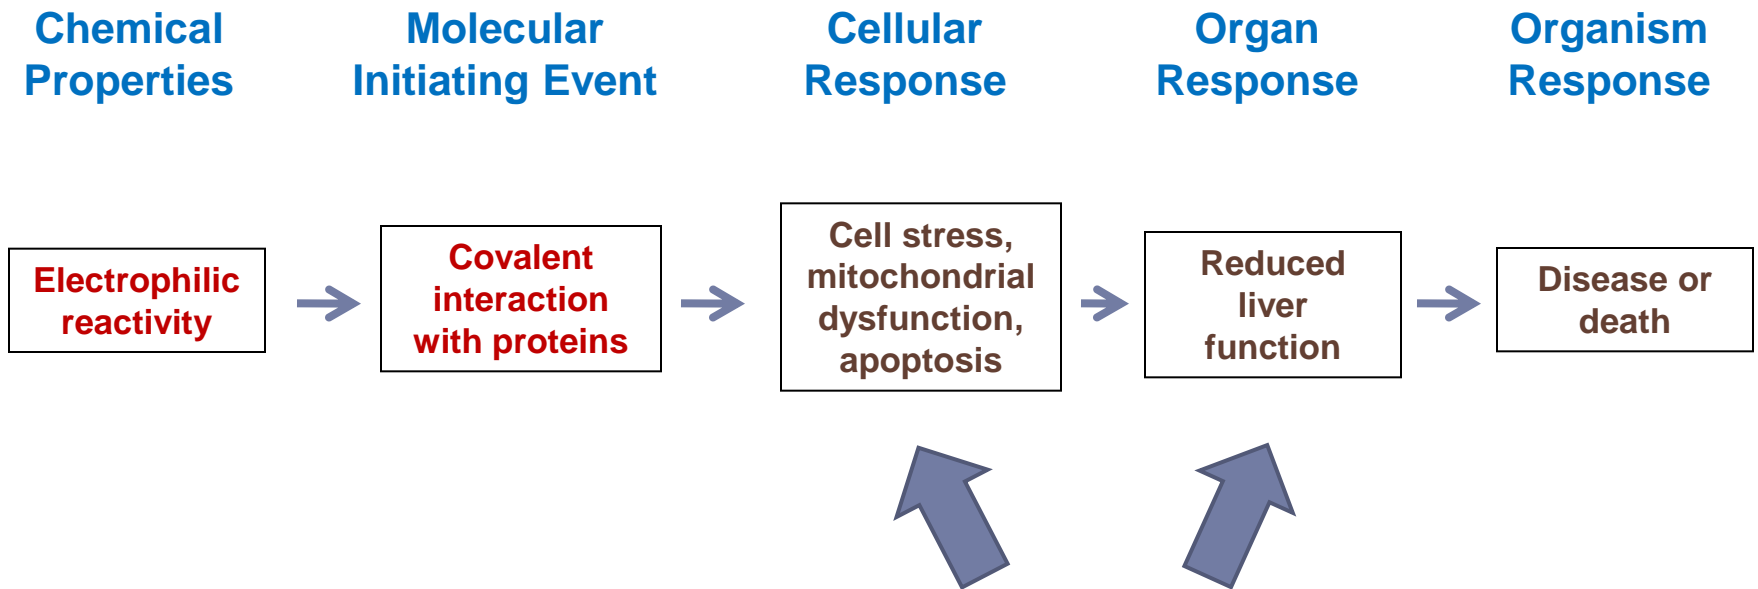

Read-Across

Adverse Outcome Pathways (AOPs): An Example for Hepatotoxicity

- Definition of electrophilic chemistry associated with hepatotoxicity required
- Few reliable *in vivo* data

Adverse Outcome Pathways (AOPs): An Example for Hepatotoxicity

- Opportunity to use *in vitro* assays and “intelligent” testing to define chemical space associated with AOP

Role of Molecular Biology, *in Vitro* Assays, -omics

- ▶ We need mechanism based assays and biomarkers
 - ▶ Tox21 / ToxCast
- ▶ Support of AOP concept
- ▶ Intelligent testing will define “domains” of chemical space

Happy AOPs: A Category for Every Occasion

- ▶ We need information on mechanisms and modes of action
- ▶ Molecular initiating events should be established
- ▶ Chemical space associated with molecular initiating events should be defined
- ▶ Support chemical categories with non-test information
 - ▶ Define the boundaries of a category
 - ▶ Quantify the potency

Another Key Challenge: Grouping for Receptor Mediated Effects

Nuclear Factor Kappa
B inhibitor (NF-K-B)

Define the applicability
domain of the structure
alert as the generic
features of the backbone
(toxicophore)

Conclusions

- ▶ Predicting chronic toxicity by QSAR is difficult
 - ▶ Multiple mechanisms within the same organ, different organ effects and modes
- ▶ Following a pathway approach (AOP or otherwise)
 - ▶ Provides mechanistic basis and framework
 - ▶ Allows for grouping
 - ▶ Allows for moderating factors / influencing to be integrated
 - ▶ Allows for other non-test information to be included
 - ▶ Transparent, more acceptable for regulatory use
 - ▶ Can be used with non-test data as part of an ITS
- ▶ Needs to make progress are definable
